the increase in the secretion of lll induced by the irritation of the splanchnik was investigated. The authors found that like the action of other drugs the action of soporifics may be nonspecific and specific. A nonspecific effect is known as one which affects the processes which are the results of the modifications in the action of mediators caused by a given substance. I has shown that luminal has a specific and a non-specific effect on the working organ, with the first predominant when large doses, and the second predominant when small doses are administered. The nonspecific action is exhibited in a weakened reaction of the organs to I, while the effect of II and potassium ions does not change. The specific effect of large doses is indicated by a primary paralysis of the cells in which they are insensitive to I, II, potassium ions, and even to barium chloride. Chloral, paraldehyde, and chloralose while nonspecific in action intensify the effect on I on the musculature. Their specific action causes contractions, which is succeeded by a second paralysis caused by exhaustion. In experiments on a dog luminal inhibited the action of I (produced a frenatal action); the greater the dose the greater its inhibition. It was impossible to differentiate between this action and its specific paralyzing action. Small doses of chloral, paraldehyde, and chloralose as a result of their nonspecific action intensify the effect of I on the nervous system; large doses depress it (specific frenatal effect). In some small animals chloralose may induce spasms. Luminal interferes with the increase in the secretion of lll by the myeloid substance of the suprernals induced by I and potassium ions. Chloral, paraldehyde, and chloralose have no effect on the secretion of lll.

Title: Determination of the Depth of the Hypocenter of the Earthquake
of 20 June 1950 in the Vrancea Mountains

Original
Periodical: Rev. Univ. "C. I. Parhon" si Politehn. Bucuresti. Ser. stiint.
natur., 1955, № 6-7, 175-179; Rumanian, Russian and French
resumés

Abstract: To determine the position of a deep earthquake in the Vrancea
Mountains, microseismic data from 20 seismic stations were used.
The average value of the depth of the earthquake was determined
($h = 170$ km). Tables are given for comparison with 14 earth-
quakes in the Vrancea Mountains, which occurred earlier and were
studied by various investigators in Rumania and abroad.

TEXT: A catalog of earthquakes with $I_o \geq 6$, which have occurred on the territory of the RPR from 1900, has been compiled. The epicenters of these earthquakes are grouped in 9 epicentral regions. The mechanism of the deep-focus earthquakes near Vranchi on November 10 and October 22, 1940, is considered. The plane approximately perpendicular to the bend of the Carpathians is chosen as the plane of rupture. The obtained results explain the shape of the isoseismals of these earthquakes. 6, no. 2, 1961, 247-258 (Rum.; summaries in Russ.
and Fr.))

TEXT: The results of studying the earthquakes that occurred on the
territory of the RPR are presented in the first part. The stronger
earthquakes are examined. The crustal structure in Europe is de-
fined. Certain judgments concerning the asthenosphere and the crus-
tal structure in the vicinity of Focșan are expressed in the second
part of the work. A value of 90 km was obtained for the astheno-
sphere's upper limit; this agrees with N. V. Shebalin's data (RZh-
Geofiz, 1962, 6A106). The granite layer's depth is defined as 13 km.

AUTHORS: Mihail,P.; Istrătoiu,R.; Topciu,R. and Petrescu,Gh.

TITLE: Direct Polymerization of Propylene From the C₃ Fraction

PERIODICAL: Revista de Chimie, 1959, Vol 10, Nr 10, pp 602-606

ABSTRACT: Rumania has rich reserves of propylene whereas its aromatics are limited; it was, therefore, natural to try to obtain polystyrene on the basis of an aliphatic product. When the problem arose, Rumania lacked a separation installation for concentrated propylene, needed in polymerization. A solution was found by obtaining polypropylene directly from the C₃ fraction which abounds in Rumanian refineries. Since in the near future important quantities of polypropylene will have to be produced, it was decided to test the procedures in a semi-industrial installation to evaluate the results technically and economically.

Card 1/3 Pertinent literature indicates the use of a ✓

RUM/3-59-10-13/16

Direct Polymerization of Propylene From the C₃ Fraction

monomer with high gas concentration (more than 95%), the polymerization being effected in a hydrocarbon solvent (pentane, hexane, etc.). The author enumerates the various advantages and disadvantages of the procedure. Experiments in the laboratory were at first conducted by using a synthetic C₃ fraction whereas presently, the process is being carried out with the C₃ fraction from refineries. The specific problems of the new procedure are: Desulfurization and purification of the C₃ fraction to make it capable of polymerization; the polymerization of propylene contained in the C₃ fraction without using another solvent; the use of residual gases remaining after polymerization; and the establishing of a technological scheme for designing a semi-industrial installation. In the laboratory, the mixture was achieved in an V2A autoclave with an anchor-type agitator, the separation being achieved by distending the

Card 2/3

Direct Polymerization of Propylene From the C₃ Fraction

gases; in the semi-industrial installation special mixers will be used, the two phases will be separated in separators while the desulfurized C₃ fraction after drying is sent to the polymerization installation. Figure 1 shows the semi-industrial installation. Parameters characteristic of the new system are: the conversion as a function of the concentration and the nature of the catalyst; the molecular weight as a function of the molar ratio catalyst cocatalyst; the conversion as a function of the temperature of the reaction; conversion as a function of the time of the reaction; and the importance of agitation. Figure 8 suggests a design for the industrial installation based on the results obtained in the laboratory.

There are 2 flow charts, 1 diagram, 5 graphs and 2 tables.

TITLE: New method of investigating voltage drops in collector machines

SOURCE: Electrotehnica, no. 7, 1965, 243-247

TOPIC TAGS: alternating current, direct current, electric shunt, magnet

ABSTRACT: The author attempts to determine whether the alternating current flowing through the windings of direct-current collector devices produces an inductive voltage drop in the armature winding even in the presence of a magnetic shunt. Using the general theory of alternating currents he concludes that there is only an ohmic voltage drop in the brushes, and confirms the conclusion by an analysis of the physical alternating phenomena of the current from the collector. Title : Treating Chronic Leukemic Myeloses by 1,4-dimethanesulfonyl-oxybutane (Myleran).

Orig Pub : Med. interna, 1957, 9, No 5, 699-709

Abstract : In 14 cases of chronic leukemic myelosis myleran (I) was used. (I) proved to be highly effective and it improved the general wellbeing of patients. (I) is most effective during the initial stages of the disease (without history of previous myleran treatment). However, satisfactory results were also obtained in some neglected cases. In cases where acquired resistance to X-Ray therapy existed, irradiation sensitivity was restored after myleran was administered. In acute myeloblastic forms of leukemia, however, myleran is completely ineffective.

Title : Experiments Involving Tobacco Drying by Infra-Red Rays

Orig Pub : Lucrarile Inst. cercetari aliment., 1958, 2, 265-274

Abstract : Experiments conducted on the drying of tobacco leaves (of the Gimpats, Virginia, Brant, Banat, Yalomita varieties) established the fact that at a distance of 45 cm from the infra-red light source the leaves surface is heated up to 65 - 70°. Good results are obtained when irradiation is applied at intervals (3 min. on 3 min. off), and also when central stem of a leaf is either removed or crushed. With infra-red drying the losses are decreased by 1 - 2%. The absorption of O₂ by tobaccos is not

Spectrographic determination of germanium and indium in minerals. I. Burducu and M. Petrescu. Acad. rep. populares Române, Stiutii cercetarii mat., 3, 559-60 (1958).— The Ge was determined in Cu concentrates, and the In in Zn concentrates. The Ge occurred in amounts of 0.000-0.06%. The Cu minerals and the standards were mixed with powd. C in the ratio 2:1, then were evapd. as anode in a d.-c. arc, of 9 amp., the samples volatilized completely in 2½ min. The standards were mixt. of the sulfides of Zn, Cu, Pb, and Fe in the proportions anticipated in the natural mineral concentrates. The Ge was introduced as GeS₂ which had been coppid. with CuS. The lines used were Ge 2681.17 and Fe 2428.29 Å., and with the background correction one gets a working curve which is linear and reproducible for the range from 0.000-0.06% Ge, and the max. error of the destr. was ±7.4% of the true Ge assay. For the In analysis the mineral was brought in soln., the soln. was freed from Fe and Mn, and the In was then coppid. with Al₂O₃. The Al₂O₃, which contained the In from the mineral and also the Al₂O₃ from the samples were mixed with CoO as internal standard and with spectroscopically pure graphite; the mixt. was then volatilized as anode in a d.-c. arc of 9 amp. The total volatilization required 3 min. Al₂O₃ was chosen to carry the In, because In would occur naturally in the original mineral assoc. with Al₂O₃. The lines In 2366.09 and Co 3250.00 Å. were used, furnishing a working curve in which log C as a function of ΔS was linear and reproducible in the region 0.01-1% In, and the max. error of the destr. was ±9% relative. Werner Jacobson

TITLE: Determination of indium in some subproducts of zinc metallurgy by spectrographic means

PERIODICAL: Referativnyy zhurnal, Metallurgiya, no. 4, 1962, 9 - 10, abstract 4K57 ("Studii si cercetări metalurgie Acad. RPR", 1961, 6, no. 1, 51 - 66, Rumanian; Russian, French summaries)

TEXT: Description is given of a spectrum analysis of In in metallic Pb, which is a secondary product of refining Zn, conducted with the use of a Feissner spark generator and a spectograph Q 24:V = 12,000 v, L = 0.8 mH, C = 4,500 pf and I = 1.30 amp. The upper electrode is a copper rod, - the lower electrode being the analyzed metallic Pb. Spacing between the electrodes is 2 - 5 mm. The analytical pair of lines is In - 3,256.09, Pb 3,262.35. The range of determinable indium concentration lies within 0.006 - 0.1%. Description is given of a method of determining In in a solution. A batch of metallic Pb, containing 0.5 - 50 mg In is dissolved in 15 ml of concentrated HCl + 5 ml of concentrated HNO₃. ↴
